The 10th IEEJ/APERC International Energy Symposium

Role of Adaptation in Climate Change Response

30 May 2025 Nobuo Mimura Ibaraki University

Contents

1. Introduction to Adaptation

- 2. Adaptation Options and Innovation Potential

 (1) Disaster risk management
 (2) Agriculture
 (3) Nature-based Solution
 (4) City Innovation
- 3. Global Landscape of CC Adaptation

Summary

Projection of Global Warming (IPCC WGI, 2021)

Gaps of Ideals and Realities!

- Global mean temperature will likely reach 1.5°C increase around 2040 or earlier.
- We are not on track to limit warming to 1.5°C.

How to respond to this situation?

What is CC Adaptation? What Roles?

4

Roles of Mitigation and Adaptation

- Mitigation and adaptation play complementary roles in reducing the CC risks.
- Since both society and natural systems have limits to adapt, mitigation must restrict climate change to within these limits.

5

Which Sectors need Adaptation?

Seven Sectors in Japan's National Adaptation Plan

- Agriculture, Forestry,
 Fisheries
- Water Environment, Water Resources
- Natural Ecosystems
- Natural Disasters, Coastal Zones
- Human Health
- Industry, Economy
- Life of the Citizens, Urban Life

What are Adaptation Options?

- Wide range of options
- Combination of measures suitable for the context of sectors and localities

Category	Туре	Examples		
Physical	Infrastructure Technology	Dike, Reservoir, Heat Shelter Monitoring, Early warning, Water res. diversification		
	Ecosystem- based	Wetland conservation, Forest protection, Green infrastructure, Ecosystem networking		
	Social service	Safety nets, Health care/insurance		
Institutional	Law/Regulation	DRM, City planning		
	Policy	Adaptation planning, Scientific information		
Economic	Economic	Tax/subsidies, CC Insurance, Redundant paths		
Social	Education	Knowledge on CC, Traditional knowledge		
	Information	CC information, Hazard maps, Workshop		
	Behavior change	Evacuation practice, Change in varieties and practices, Lifestyle change, migration		

(1) Adaptation in Disaster Risk Management

Damages of water disasters for the past 10 years (except tsunami)

国土交通省まとめ

New Watershed Management: "River Basin Disaster Resilience and Sustainability by All"

•Dams

S18-3-3 Prof. Kazama, Tohoku U

Mitigation options

GHG control

Flood control 河川整備計画達成

Pumping capacity 1/10内水排水達成

Pilotis houses

10000人/km²以上&1/30で0.5m以上に 水深5mまで被害無し

Paddy dam 全てのたんぼに貯留効果

Land use control 10000人/km²以下&1/200で水深3m以

Difference of 4°C and 2°C impacts

10

	Option	Reduction Rate of Economic impact	
Mitigation	From 4°C to 2°C	- 22%	
	Flood control	- 14%	
	Pumping capacity	- 26%	
Adaptation	Land use control	-24%	T
	Pilotis houses	- 68%	
	Paddy dam	- 7%	

Integration of mitigation and adaptation is crucial to manage the risk of climate change.

(2) Adaptation in Agriculture

Technologies

- Heat-tolerant crop varieties
- Cultivation method, irrigation
- Pests, diseases, damage by birds and wild animals
- ICT and drones

Utilizing Opportunities

- Expanding production areas to higher-latitude regions
- Subtropical and tropical crops.
- Expanding the cultivation period and areas

Collaboration of Stakeholders

- Promoting locally-led adaptation
- Implementation of adaptation through collaboration between national, local governments and stakeholders

Heat-Tolerant Rice Varieties

(3) Nature-based Solution (NbS) Ecosystem-based Adaptation (EbA)

Disaster Prevention, Infrastructure, Urban Planning

Green Infrastructure

- Utilizing the diverse functions of the natural environment
- Aiming to create sustainable and attractive communities.

EcoDRR (Ecosystem-based Disaster Risk Reduction)

The use of ecosystem functions to prevent and mitigate disasters.

EbA (Ecosystem-based Adaptation)

• Adaptation measures to climate change that leverage the functions of ecosystems.

NbS (Nature-based Solutions)

- Actions that address societal challenges by managing the natural environment.
- Simultaneously delivering co-benefits for humans and biodiversity.

(4) Adaptation for City Innovation

Copenhagen's Challenges

- 2011 Copenhagen Climate Adaptation Plan
- 2012 CPH 2025 Climate Plan
- 2016 First Climate Resilient Neighborhood
- 2021 CPH 2025 Climate Plan - Roadmap 2021–2025 (5-year Action Plan)

[Targets]

- World first carbon neutral capital by 2025
- Excellent chance for urban development

[Adaptation Plan]

Climate change planning is an excellent chance for urban development

Copenhagen Solution for Sustainable Cities

Urban Greening: From City-level to Neighborhood

To make the city more attractive, heat-torelant and resilient •

Tåsinge Plads after the transformation. Constructed by Malmos and designed by GHB. Orbicon and ViaTrafik as consulting engineers. Photograph: Charlotte Brøndum

TÁSINGE PLADS

The Climate Resilient Neighbourhood's first urban space adapted to climate change. Here rainwater from an area of more than 7,000 m² is managed, while a multifunctional green urban space is created for the neighbourhood.

BRYGGERVANGEN

A green connecting link, where raingardens, swales etc. provide experience of nature in the centre of the city. The project is expected to be completed in 2018.

HARALDS PLADS

28

Haralds Plads was renovated in the autumn of 2015.A large green bed with perenials and schrubs has been created and benches have been installed, including urban furniture for skating.

SKT. KJELDS PLADS

A green square full of character, the future gathering point of the neighbourhood, and at the same time a pilot project in climate change adaptation. The project is expected to be completed in 2018.

KILDEVÆLDSPARKEN

Frisporet is a new activity space north of Kildevældsparken. The focus is on nature, play and discovery. In addition, there is a park for dogs and new playing fields.

STRANDBOULEVARDEN

Strandboulevarden will in the future become a blue and green street that both protects the area against flooding and creates a liveful and green space.

ØSTERBROGADE / CARL N.ALLÉ The streets ensure that the rainwater is transported to the harbour and at the same time green spaces is developed.

FUTURE GREEN COURTYARD AT SKT. KJELDS PLADS A pilot project on rainwater management in courtyard spaces. Expected to be completed in 2016.

CLIMATE RESILIENT BLOCK A sustainable project where rainwater management, and rainwater collection and energy optimisation of buildings.

Copenhagen's first-climate resilient neighborhood, 2016

Global Landscape of CC Adaptation

- Adaptation Planning: 80% of countries have adaptation plands or initiative
- Major targets are Agriculture, Infrastructure, Water and natural disasters.

LANDSCAPE OF CLIMATE FINANCE IN 2021/2022

Global climate finance flows along their life cycle in 2021 and 2022. Values are averages of two years' data to smooth out fluctuations, in USD billions

"Other" private sources include institutional investors, funds, and unknown

Financial Flows

- Adaptation 68 B\$
 Mitigation 1,171B\$
- No substantial flows to the Global South
- Given the severe impacts, adaptation is critical for the Global South.
- Adaptation has synergies with the development targets.

Climate Resilient Development (CRD)

- Reduce climate risks adaptation
- Reduce greenhouse gas emissions mitigation
- Enhance biodiversity
- Achieve the Sustainable Development Goals

Summary: Role of Adaptation

Risk Management of Climate Change

- Adaptation is to minimize impacts and damages caused by CC.
- Integration of mitigation and adaptation
- Need to note "the limit to adaptation"

Drivers for a Resilient and Sustainable Development

- Wider implications of CC responses
- Solutions with multiple effects: NbS, City innovation, Regional revitalization
- Contribute to transition to Resilient and Sustainable Development Mitigation: Zero-emission society based on renewable energies. Adaptation: Climate resilient society

CC Adaptation plays a role to overcome the current gap of "ideals and realities".

Thank you for your attention!

Distribution of Adaptation Option Categories by Sector in Japan

Appendix 1

Adaptation measures depend on the impacts, regional environments, and social characteristics.

Appendix 2 Elements of Society's Resilience (Adaptive Capacity)

• Building the society's resilience means developing the comprehensive capacity of the society to respond to threats caused by CC and other hazards.

Appendix 3

Distribution of Vulnerability in the World

- Vulnerable regions include Africa, South Asia, Latin America, small island nations, and the Arctic. Currently, 3.3 billion people live in these areas.
- Even in developed countries, vulnerable populations such as the poor, children, the elderly, and people with disabilities are more severely affected.
 (IPCCAR6 WG2 Report SPM ,2022)
